#### Abstract

Let $X$ be an $n$-square complex matrix with the Cartesian decomposition $X=A+i B$, where $A$ and $B$ are $n \times n$ Hermitian matrices. It is known that $\|X\|_{p}^{2} \leq 2\left(\|A\|_{p}^{2}+\|B\|_{p}^{2}\right.$ ), where $p \geq 2$ and $\|.\|_{p}$ is the Schatten $p-$ norm. In this paper, this inequality and some of its improvements are studied and investigated for the joint $C$-numerical radius, joint spectral radius, and for the $C$-spectral norm of matrices.

(C) (2016) Wavelets and Linear Algebra

## 1. Introduction and preliminaries

Let $\mathbb{M}_{n}$ be the algebra of all $n \times n$ complex matrices and $\mathcal{U}_{n}$ be the group of unitary matrices in $\mathbb{M}_{n}$. For every $X \in \mathbb{M}_{n}$ with singular values $s_{1} \geqslant s_{2} \geqslant \cdots \geq s_{n}$, and for every $2 \leq p<\infty$,

[^0]let $\|X\|_{p}=\left(\sum_{j=1}^{n} s_{j}^{p}\right)^{\frac{1}{p}}$ be the Schatten $p$-norm of $X$. Also, the spectral norm of $X$ is defined as $\|X\|=\max _{\|x\|_{2}=1}\|X x\|_{2}$, where $\|.\|_{2}$ is the Euclidean vector norm on $\mathbb{C}^{n}$. It is known that $\|X\|=s_{1}$ which is usually denoted by $\|X\|_{\infty}$. Also, it is evident that these norms are unitarily invariant. For more information, see [8].

Let $X, C \in \mathbb{M}_{n}$ have eigenvalues $\alpha_{1}, \ldots, \alpha_{n}$ and $\gamma_{1}, \ldots, \gamma_{n}$, respectively. The $C$-spectral radius, $C$-numerical radius and the $C$-spectral norm of $X$ are defined and denoted, respectively, by:

$$
\begin{gather*}
\rho_{C}(X)=\max \left\{\left|\sum_{j=1}^{n} \alpha_{j} \gamma_{\sigma(j)}\right|: \sigma \text { is a permutation of }\{1,2, \ldots, n\}\right\}, \\
r_{C}(X)=\max \left\{\left|t r\left(C U X U^{*}\right)\right|: U \in \mathcal{U}_{n}\right\} \tag{1.1}
\end{gather*}
$$

and

$$
\|X\|_{C}=\max \left\{\left|\operatorname{tr}\left(C U X V^{*}\right)\right|: U, V \in \mathcal{U}_{n}\right\} .
$$

It is known that

$$
\begin{equation*}
\rho_{C}(X) \leqslant r_{C}(X) \leqslant\|X\|_{C}=\sum_{j=1}^{n} s_{j}(X) s_{j}(C) . \tag{1.2}
\end{equation*}
$$

For the case $C=\operatorname{diag}(1,0, \ldots, 0) \in \mathbb{M}_{n}$, the inequality (1.2) reduces to

$$
\rho(X) \leqslant r(X) \leqslant\|X\|
$$

where $\rho(X)=\max \left\{\left|\alpha_{j}\right|: j=1, \ldots, n\right\}$ and $r(X)=\max \left\{\left|x^{*} X x\right|: x \in \mathbb{C}^{n}, x^{*} x=1\right\}$ are the spectral radius and the numerical radius of $X$, respectively. One should note that the $C$-numerical radius for the case that $C \in \mathbb{M}_{n}$ is a nonscalar matrix, is a norm on $\mathbb{M}_{n}$ which is not necessarily invariant under unitary transformations. Also, the spectral radius is not a norm on $\mathbb{M}_{n}$. For more information about the $C$-numerical radius, $C$-spectral radius and the $C$-spectral norm of matrices and their applications, see [10, 12] and references therein.

Let $C \in \mathbb{M}_{n}$. The joint $C$-numerical radius of $\left(X_{1}, \ldots, X_{k}\right) \in \mathbb{M}_{n}^{k}$ is

$$
r_{C}\left(X_{1}, \ldots, X_{k}\right):=\sup \left\{\ell_{2}\left(a_{1}, \ldots, a_{k}\right):\left(a_{1}, \ldots, a_{k}\right) \in W_{C}\left(X_{1}, \ldots, X_{k}\right)\right\}
$$

where $\ell_{2}\left(a_{1}, \ldots, a_{k}\right)=\left(\sum_{j=1}^{k}\left|a_{j}\right|^{2}\right)^{1 / 2}$ is the usual Euclidean norm, and

$$
W_{C}\left(X_{1}, \ldots, X_{k}\right)=\left\{\left(\operatorname{tr}\left(C U X_{1} U^{*}\right), \ldots, \operatorname{tr}\left(C U X_{k} U^{*}\right)\right): U \in \mathcal{U}_{n}\right\}
$$

is the joint $C$-numerical range of $\left(X_{1}, \ldots, X_{k}\right)$; for more information, see [1] and its references. By setting $C=\operatorname{diag}(1,0, \ldots, 0) \in \mathbb{M}_{n}$, we see that $r_{C}\left(X_{1}, \ldots, X_{k}\right)$ reduces to the joint numerical radius of $\left(X_{1}, \ldots, X_{k}\right)$; i.e.,

$$
\begin{aligned}
r_{C}\left(X_{1}, \ldots, X_{k}\right) & =r\left(X_{1}, \ldots, X_{k}\right) \\
& :=\sup \left\{\ell_{2}\left(a_{1}, \ldots, a_{k}\right):\left(a_{1}, \ldots, a_{k}\right) \in W\left(X_{1}, \ldots, X_{k}\right)\right\},
\end{aligned}
$$

where $W\left(X_{1}, \ldots, X_{k}\right)=\left\{\left(x^{*} X_{1} x, \ldots, x^{*} X_{k} x\right): x \in \mathbb{C}^{n}, x^{*} x=1\right\}$ is the joint numerical range of $\left(X_{1}, \ldots, X_{k}\right)$. Note that for the case $k=1$, this notion reduces to relation (1.1). For other classes
of norms $v$ on $\mathbb{C}^{k}$, we can extend our results to the $v$-joint numerical radius of $\left(X_{1}, \ldots, X_{k}\right) \in \mathbb{M}_{n}^{k}$, which is defined as

$$
r_{v}\left(X_{1}, \ldots, X_{k}\right)=\sup \left\{v\left(a_{1}, \ldots, a_{k}\right):\left(a_{1}, \ldots, a_{k}\right) \in W\left(X_{1}, \ldots, X_{k}\right)\right\} .
$$

So, $r_{\ell_{2}}\left(X_{1}, \ldots, X_{k}\right)=r\left(X_{1}, \ldots, X_{k}\right)$.
Let $\left(X_{1}, \ldots, X_{k}\right) \in \mathbb{M}_{n}^{k}$. The joint spectrum $\sigma\left(X_{1}, \ldots, X_{k}\right)$ is the set of all points $\left(\lambda_{1}, \ldots, \lambda_{k}\right) \in$ $\mathbb{C}^{k}$ for which there exists a nonzero vector $x \in \mathbb{C}^{n}$ such that

$$
X_{j} x=\lambda_{j} x, \quad j=1, \ldots, k .
$$

The joint spectrum of matrices may be an empty set; for an example, see [13, p. 226]. It can be a nonempty set; see [2, Proposition 2.3(iii)]. So, we assume, to avoid of trivial cases, that $X_{1}, \ldots, X_{k}$ are the matrices such that $\sigma\left(X_{1}, \ldots, X_{k}\right)$ is a nonempty set. In this sense, the geometric joint spectral radius of $\left(X_{1}, \ldots, X_{k}\right)$ is defined, e.g., see [4], as

$$
\rho\left(X_{1}, \ldots, X_{k}\right)=\max \left\{\ell_{2}\left(\lambda_{1}, \ldots, \lambda_{k}\right):\left(\lambda_{1}, \ldots, \lambda_{k}\right) \in \sigma\left(X_{1}, \ldots, X_{k}\right)\right\} .
$$

Let $X \in \mathbb{M}_{n}$ be a matrix with the Cartesian decomposition $X=\operatorname{Re} X+i \operatorname{Im} X$, where $\operatorname{Re} X=$ $\frac{1}{2}\left(X+X^{*}\right)$ and $\operatorname{Im} X=\frac{1}{2 i}\left(X-X^{*}\right)$. Corollary 1 in [5] is an improvement of the following inequality:

$$
\begin{equation*}
\|X\|_{p}^{2} \leq 2\left(\|R e X\|_{p}^{2}+\|I m X\|_{p}^{2}\right), \tag{1.3}
\end{equation*}
$$

where $p \geq 2$. In the two last decades, some interesting norm inequalities involving the Cartesian decomposition of matrices have been obtained; see for example [9] and its references. These kinds of inequalities have applications in the analysis of operators [3], and in mathematical physics [14]. In the next section of this paper, we study the inequality (1.3) and some of its improvements for the joint $C$-numerical radius, joint spectral radius, and for the $C$-spectral norm of matrices.

## 2. Main results

At first, we investigate the inequality (1.3) for the joint $C$-numerical radius of matrices.
Theorem 2.1. Let $\left(X_{1}, \ldots, X_{k}\right) \in \mathbb{M}_{n}^{k}$, and $C \in \mathbb{M}_{n}$. Then

$$
r_{C}^{2}\left(X_{1}, \ldots, X_{k}\right) \leqslant 2\left(r_{C}^{2}\left(\operatorname{Re} X_{1}, \ldots, \operatorname{Re} X_{k}\right)+r_{C}^{2}\left(\operatorname{Im} X_{1}, \ldots, \operatorname{Im} X_{k}\right)\right) .
$$

Proof. For every $U \in \mathcal{U}_{n}$, we have

$$
\begin{aligned}
2 & \left(r_{C}^{2}\left(\operatorname{Re} X_{1}, \ldots, \operatorname{Re} X_{k}\right)+r_{C}^{2}\left(\operatorname{Im} X_{1}, \ldots, \operatorname{Im} X_{k}\right)\right) \\
\geqslant & 2 \ell_{2}^{2}\left(\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Re} X_{1}\right) U^{*}\right), \ldots, \operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Re} X_{k}\right) U^{*}\right)\right) \\
& +2 \ell_{2}^{2}\left(\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Im} X_{1}\right) U^{*}\right), \ldots, \operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Im} X_{k}\right) U^{*}\right)\right) \\
= & 2 \sum_{i=1}^{k}\left(\left|\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Re} X_{i}\right) U^{*}\right)\right|^{2}+\left|\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Im} X_{i}\right) U^{*}\right)\right|^{2}\right) \\
= & \frac{1}{2} \sum_{i=1}^{k}\left(\left|\operatorname{tr}\left(C U\left(X_{i}+X_{i}^{*}\right) U^{*}\right)\right|^{2}+\left|\operatorname{tr}\left(C U\left(X_{i}-X_{i}^{*}\right) U^{*}\right)\right|^{2}\right) \\
\geqslant & \frac{1}{4} \sum_{i=1}^{k}\left(\left|\operatorname{tr}\left(C U\left(X_{i}+X_{i}^{*}\right) U^{*}\right)\right|+\left|\operatorname{tr}\left(C U\left(X_{i}-X_{i}^{*}\right) U^{*}\right)\right|\right)^{2} \\
\geqslant & \frac{1}{4} \sum_{i=1}^{k}\left|\operatorname{tr}\left(C U\left(X_{i}+X_{i}^{*}\right) U^{*}\right)+\operatorname{tr}\left(C U\left(X_{i}-X_{i}^{*}\right) U^{*}\right)\right|^{2} \\
= & \sum_{i=1}^{k}\left|\operatorname{tr}\left(C U X_{i} U^{*}\right)\right|^{2} \\
= & \ell_{2}^{2}\left(\operatorname{tr}\left(C U X_{1} U^{*}\right), \ldots, \operatorname{tr}\left(C U X_{k} U^{*}\right)\right) .
\end{aligned}
$$

Taking now the maximum over all $U \in \mathcal{U}_{n}$, we obtain the result.
By setting $k=1$ in Theorem 2.1, we obtain the following result.
Corollary 2.2. Let $X, C \in \mathbb{M}_{n}$. Then

$$
r_{C}^{2}(X) \leqslant 2\left(r_{C}^{2}(\operatorname{Re} X)+r_{C}^{2}(\operatorname{Im} X)\right) .
$$

Now, we state one of the interesting improvements of Theorem 2.1.
Theorem 2.3. Let $\left(X_{1}, \ldots, X_{k}\right) \in \mathbb{M}_{n}^{k}$, and $C \in \mathbb{M}_{n}$ be a multiple of a Hermitian matrix. Then

$$
r_{C}^{2}\left(X_{1}, \ldots, X_{k}\right) \leqslant r_{C}^{2}\left(\operatorname{Re} X_{1}, \ldots, \operatorname{Re} X_{k}\right)+r_{C}^{2}\left(\operatorname{Im} X_{1}, \ldots, \operatorname{Im} X_{k}\right) .
$$

Consequently,

$$
r^{2}\left(X_{1}, \ldots, X_{k}\right) \leqslant r^{2}\left(\operatorname{Re} X_{1}, \ldots, \operatorname{Re} X_{k}\right)+r^{2}\left(\operatorname{Im} X_{1}, \ldots, \operatorname{Im} X_{k}\right) .
$$

Proof. We assume, without loss of generality, that $C$ is Hermitian. For every $U \in \mathcal{U}_{n}$, we have

$$
\begin{aligned}
r_{C}^{2}\left(\operatorname{Re} X_{1}, \ldots, \operatorname{Re} X_{k}\right)+ & r_{C}^{2}\left(\operatorname{Im} X_{1}, \ldots, \operatorname{Im} X_{k}\right) \\
\geqslant & \ell_{2}^{2}\left(\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Re} X_{1}\right) U^{*}\right), \ldots, \operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Re} X_{k}\right) U^{*}\right)\right) \\
& +\ell_{2}^{2}\left(\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Im} X_{1}\right) U^{*}\right), \ldots, \operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Im} X_{k}\right) U^{*}\right)\right) \\
= & \sum_{i=1}^{k}\left(\left|\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Re} X_{i}\right) U^{*}\right)\right|^{2}+\left|\operatorname{tr}\left(\operatorname{CU}\left(\operatorname{Im} X_{i}\right) U^{*}\right)\right|^{2}\right) \\
= & \frac{1}{4} \sum_{i=1}^{k}\left(\left|\operatorname{tr}\left(C U\left(X_{i}+X_{i}^{*}\right) U^{*}\right)\right|^{2}+\left|\operatorname{tr}\left(C U\left(X_{i}-X_{i}^{*}\right) U^{*}\right)\right|^{2}\right) \\
\geqslant & \left.\frac{1}{4} \sum_{i=1}^{k}| | \operatorname{tr}\left(C U\left(X_{i}+X_{i}^{*}\right) U^{*}\right)\right]^{2}-\left[\operatorname{tr}\left(C U\left(X_{i}-X_{i}^{*}\right) U^{*}\right)\right]^{2} \mid \\
= & \sum_{i=1}^{k}\left|\operatorname{tr}\left(C U X_{i} U^{*}\right)\right|\left|\operatorname{tr}\left(C U X_{i}^{*} U^{*}\right)\right| \\
= & \sum_{i=1}^{k}\left|\operatorname{tr}\left(C U X_{i} U^{*}\right)\right|\left|\operatorname{tr}\left(\left(U X_{i} U^{*} C\right)^{*}\right)\right| \\
= & \sum_{i=1}^{k}\left|\operatorname{tr}\left(C U X_{i} U^{*}\right)\right|\left|\operatorname{tr}\left(C U X_{i} U^{*}\right)\right| \\
= & \sum_{i=1}^{k}\left|\operatorname{tr}\left(C U X_{i} U^{*}\right)\right|^{2} \\
= & \ell_{2}^{2}\left(\operatorname{tr}\left(C U X_{1} U^{*}\right), \ldots, \operatorname{tr}\left(C U X_{k} U^{*}\right)\right) .
\end{aligned}
$$

Taking now the maximum over all $U \in \mathcal{U}_{n}$, we obtain the result. By setting $C=\operatorname{diag}(1,0, \ldots, 0) \in$ $\mathbb{M}_{n}$, the second assertion also holds. So, the proof is complete.

By setting $k=1$ in Theorem 2.3, we obtain the following result.
Corollary 2.4. Let $X, C \in \mathbb{M}_{n}$ and let $C$ be a multiple of a Hermitian matrix. Then

$$
r_{C}^{2}(X) \leqslant r_{C}^{2}(\operatorname{Re} X)+r_{C}^{2}(\operatorname{Im} X) .
$$

Consequently,

$$
r^{2}(X) \leqslant r^{2}(\operatorname{Re} X)+r^{2}(\operatorname{Im} X)
$$

Next, we are going to investigate an improvement of the inequality (1.3) for the $C$-spectral radius of matrices. For this, we need the following lemma.

Lemma 2.5. [12, Theorem 4.1] Let $C \in \mathbb{M}_{n}$. Then $C$ is normal if and only if $\rho_{C}(X)=r_{C}(X)$ for all normal matrices $X \in \mathbb{M}_{n}$.

Theorem 2.6. Let $X, C \in \mathbb{M}_{n}$ and let $C$ be a multiple of a Hermitian matrix. Then

$$
\rho_{C}^{2}(X) \leqslant \rho_{C}^{2}(\operatorname{Re} X)+\rho_{C}^{2}(\operatorname{Im} X) .
$$

Consequently,

$$
\rho^{2}(X) \leqslant \rho^{2}(\operatorname{Re} X)+\rho^{2}(\operatorname{Im} X) .
$$

Proof. Since ReX and $\operatorname{Im} X$ are Hermitian, the result follows from (1.2), Corollary 2.4 and Lemma 2.5. By setting $C=\operatorname{diag}(1,0, \ldots, 0) \in \mathbb{M}_{n}$, the second assertion also holds. So, the proof is complete.

The following example shows that if $C$ is an arbitrary normal matrix, then the results in Corollary 2.4 and Theorem 2.6 are not true.

Example 2.7. Let $C=X=\operatorname{diag}(1,1+i) \in \mathbb{M}_{2}$. Then by Lemma 2.5, we have:

$$
r_{C}^{2}(X)=\rho_{C}^{2}(X)=8, r_{C}^{2}(\operatorname{Re} X)=\rho_{C}^{2}(\operatorname{Re} X)=5, \text { and } r_{C}^{2}(\operatorname{Im} X)=\rho_{C}^{2}(\operatorname{Im} X)=2
$$

Hence,

$$
r_{C}^{2}(X)=\rho_{C}^{2}(X)=8>7=r_{C}^{2}(\operatorname{Re} X)+r_{C}^{2}(\operatorname{Im} X)=\rho_{C}^{2}(\operatorname{Re} X)+\rho_{C}^{2}(\operatorname{Im} X) .
$$

By the same manner as in the proof of Theorem 2.1, we have the following result in which we investigate the inequality (1.3) for the $C$-spectral norm.
Proposition 2.8. Let $X, C \in \mathbb{M}_{n}$. Then

$$
\|X\|_{C}^{2} \leqslant 2\left(\|\operatorname{Re} X\|_{C}^{2}+\|\operatorname{Im} X\|_{C}^{2}\right) .
$$

Consequently,

$$
\|X\|^{2} \leqslant 2\left(\|\operatorname{Re} X\|^{2}+\|I m X\|^{2}\right) .
$$

Now, we state an improvement of Proposition 2.8. For this, we need the following lemma.
Lemma 2.9. [12, Theorem 5.11] Let $X \in \mathbb{M}_{n}$ have singular values $a_{1} \geqslant \cdots \geqslant a_{n}$ and eigenvalues $\alpha_{1}, \ldots, \alpha_{n}$, where $\left|\alpha_{1}\right| \geqslant \cdots \geqslant\left|\alpha_{n}\right|$. Moreover, let $C=\operatorname{diag}\left(\gamma_{1}, \ldots, \gamma_{m}, 0, \ldots, 0\right) \in \mathbb{M}_{n}$, where $\gamma_{1} \geqslant \cdots \geqslant \gamma_{m}>0$. Then $\|X\|_{C}=r_{C}(X)$ if and only if there exists $\theta \in \mathbb{R}$ such that $\alpha_{j}=a_{j} e^{i \theta}$ for all $j=1, \ldots, m$.

Theorem 2.10. Let $X \in \mathbb{M}_{n}$ have singular values $a_{1} \geqslant \cdots \geqslant a_{n}$ and eigenvalues $\alpha_{1}, \ldots, \alpha_{n}$, where $\left|\alpha_{1}\right| \geqslant \cdots \geqslant\left|\alpha_{n}\right|$. If $C=\operatorname{diag}\left(\gamma_{1}, \ldots, \gamma_{m}, 0, \ldots, 0\right) \in \mathbb{M}_{n}$, where $\gamma_{1} \geqslant \cdots \geqslant \gamma_{m}>0$, and there exists a $\theta \in \mathbb{R}$ such that $\alpha_{j}=a_{j} e^{i \theta}$ for all $j=1, \ldots, m$, then

$$
\|X\|_{C}^{2} \leqslant\|\operatorname{Re} X\|_{C}^{2}+\|\operatorname{Im} X\|_{C}^{2} .
$$

Proof. By Lemma 2.9, we have $\|X\|_{C}=r_{C}(X)$. So, by Corollary 2.4 and relation (1.2), we have:

$$
\begin{aligned}
\|X\|_{C}^{2}=r_{C}^{2}(X) & \leqslant r_{C}^{2}(\operatorname{Re} X)+r_{C}^{2}(\operatorname{Im} X) \\
& \leqslant\|\operatorname{Re} X\|_{C}^{2}+\|\operatorname{Im} X\|_{C}^{2} .
\end{aligned}
$$

So, the proof is complete.

Corollary 2.11. Let $X \in \mathbb{M}_{n}$ be a normal matrix with eigenvalues $\alpha_{1}, \ldots, \alpha_{n}$, where $\left|\alpha_{1}\right| \geqslant$ $\cdots \geqslant\left|\alpha_{n}\right|$. If $1 \leq m \leq n$ and $\alpha_{1}, \ldots, \alpha_{m}$ lie on a line passing through the origin, and $C=$ $\operatorname{diag}\left(\gamma_{1}, \ldots, \gamma_{m}, 0, \ldots, 0\right)$, where $\gamma_{1} \geqslant \cdots \geqslant \gamma_{m}>0$, then

$$
\|X\|_{C}^{2} \leqslant\|\operatorname{Re} X\|_{C}^{2}+\|\operatorname{Im} X\|_{C}^{2}
$$

Consequently, if $X \in \mathbb{M}_{n}$ is a normal matrix, then

$$
\|X\|^{2} \leqslant\|\operatorname{Re} X\|^{2}+\|I m X\|^{2} .
$$

The following example shows that in Theorem 2.10, we can not remove the condition $\alpha_{j}=$ $a_{j} e^{i \theta}$ for all $j=1, \ldots, m$.
Example 2.12. If $X=\left[\begin{array}{ll}0 & 1 \\ 0 & 0\end{array}\right]$ and $C=\operatorname{diag}(1,0)$, then $a_{1}=1$ and $\alpha_{1}=0$. So, there is no $\theta \in \mathbb{R}$ such that $\alpha_{1}=a_{1} e^{i \theta}$. A simple calculation shows that:

$$
\|\operatorname{Re} X\|_{C}^{2}+\|I m X\|_{C}^{2}=\frac{1}{2}<1=\|X\|_{C}^{2} .
$$

Since $\sigma\left(X_{1}, \ldots, X_{k}\right) \subseteq W\left(X_{1}, \ldots, X_{k}\right)$,

$$
\begin{equation*}
\rho\left(X_{1}, \ldots, X_{k}\right) \leqslant r\left(X_{1}, \ldots, X_{k}\right) . \tag{2.1}
\end{equation*}
$$

Also, it is known, e.g., see [2, Proposition 2.3(iii)], that if ( $X_{1}, X_{2}, \ldots, X_{k}$ ) is a family of commuting normal matrices, then

$$
\begin{equation*}
W\left(X_{1}, \ldots, X_{k}\right)=\operatorname{conv}\left(\sigma\left(X_{1}, \ldots, X_{k}\right)\right), \tag{2.2}
\end{equation*}
$$

where $\operatorname{conv}($.$) denotes the convex hull. Now, we state the following proposition which follows$ from relations (2.1) and (2.2), and Corollary 2.4. It is an improvement of the inequality (1.3) for the joint spectral radius of matrices.

Proposition 2.13. Let $X_{1}, X_{2}, \ldots, X_{k} \in \mathbb{M}_{n}$ be such that $\left\{\operatorname{Re} X_{i}: i=1, \ldots, k\right\}$ and $\left\{\operatorname{Im} X_{i}: i=\right.$ $1, \ldots, k\}$ are two commuting families. Then

$$
\rho^{2}\left(X_{1}, \ldots, X_{k}\right) \leqslant \rho^{2}\left(\operatorname{Re} X_{1}, \ldots, \operatorname{Re} X_{k}\right)+\rho^{2}\left(\operatorname{Im} X_{1}, \ldots, \operatorname{Im} X_{k}\right)
$$

Finally, we present some $v$-joint numerical radius inequalities. See [6, 7, 11] for related inequalities. For any vectors $x=\left(x_{1}, \ldots, x_{k}\right), y=\left(y_{1}, \ldots, y_{k}\right) \in \mathbb{C}^{k}$, we define $|x|=\left(\left|x_{1}\right|, \ldots,\left|x_{k}\right|\right)$, and we say that $|x| \leqslant|y|$ if $\left|x_{i}\right| \leqslant\left|y_{i}\right|$ for all $i=1, \ldots, k$. A vector norm $v$ on $\mathbb{C}^{k}$ is said to be:
(a) monotone if the inequality $|x| \leqslant|y|$ implies that $v(x) \leqslant v(y)$ for all $x, y \in \mathbb{C}^{k}$;
(b) absolute if $v(x)=v(|x|)$ for all $x \in \mathbb{C}^{k}$.

It is known, e.g., see [8], that the monotonicity of a norm on $\mathbb{C}^{k}$ is equivalent to its absolutivity. For example, the familiar $\ell_{p}$-vector norms on $\mathbb{C}^{k}$ which are defined as

$$
\ell_{p}\left(x_{1}, \ldots, x_{k}\right)=\left(\sum_{j=1}^{k}\left|x_{j}\right|^{p}\right)^{1 / p} \text { and } \ell_{\infty}\left(x_{1}, \ldots, x_{k}\right)=\max _{1 \leqslant i \leqslant k}\left|x_{i}\right| \text {, }
$$

where $1 \leqslant p<\infty$, are absolute, and consequently are monotone. Next, we state the following proposition.

Proposition 2.14. If $v$ is an absolute norm on $\mathbb{C}^{k}$, then for all $X_{1}, X_{2}, \ldots, X_{k} \in \mathbb{M}_{n}$,

$$
r_{\nu}\left(X_{1}, \ldots, X_{k}\right) \leqslant v\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) .
$$

## Consequently,

$$
r\left(X_{1}, \ldots, X_{k}\right) \leqslant \ell_{2}\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right)
$$

Proof. Let $X_{1}, X_{2}, \ldots, X_{k} \in \mathbb{M}_{n}$. For any arbitrary $\left(a_{1}, \ldots, a_{k}\right) \in W\left(X_{1}, \ldots, X_{k}\right)$, we have that $\left|a_{i}\right| \leqslant r\left(X_{i}\right)$ for all $i=1, \ldots, k$. So, the absolutivity, and hence, the monotonicity of $v$ implies that

$$
v\left(a_{1}, \ldots, a_{k}\right)=v\left(\left|a_{1}\right|, \ldots,\left|a_{k}\right|\right) \leqslant v\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) .
$$

Taking now the maximum over all $\left(a_{1}, \ldots, a_{k}\right) \in W\left(X_{1}, \ldots, X_{k}\right)$, we obtain the result. By setting $v=\ell_{2}$, the second assertion also holds. So, the proof is complete.

The following example shows that the absolutivity of the norm in the Proposition 2.14 is essential.

Example 2.15. Define $v\left(x_{1}, x_{2}\right)=\left|x_{1}-x_{2}\right|+\left|x_{2}\right|$, which is not absolute. Now, by considering $X_{1}=\operatorname{diag}(-1,-2)$ and $X_{2}=\operatorname{diag}(1,0)$, it is clear that

$$
r_{\nu}\left(X_{1}, X_{2}\right)=\max \left\{v\left(a_{1}, a_{2}\right):\left(a_{1}, a_{2}\right) \in W\left(X_{1}, X_{2}\right)\right\}=3 .
$$

But, $v\left(r\left(X_{1}\right), r\left(X_{2}\right)\right)=v(2,1)=2$. Hence, $v\left(r\left(X_{1}\right), r\left(X_{2}\right)\right)<r_{v}\left(X_{1}, X_{2}\right)$.
The following definition is related to the study of the converse of Proposition 2.14.
Definition 2.16. A vector norm $v$ on $\mathbb{C}^{k}$ is said to be weakly absolute if $v(x) \leqslant v(|x|)$ for all $x \in \mathbb{C}^{k}$.
Proposition 2.17. Let $v$ be a vector norm on $\mathbb{C}^{k}$ such that for all $X_{1}, \ldots, X_{k} \in \mathbb{M}_{n}$,

$$
r_{v}\left(X_{1}, \ldots, X_{k}\right) \leqslant v\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) .
$$

Then $v$ is a weakly absolute norm on $\mathbb{C}^{k}$.
Proof. Let $\gamma_{1}, \ldots, \gamma_{k} \in \mathbb{C}$. By setting $X_{i}=\gamma_{i} I_{n}$, where $i=1, \ldots, k$, and using Proposition 2.14, we have that $\left|\gamma_{i}\right|=r\left(X_{i}\right)$, and

$$
\begin{aligned}
v\left(\gamma_{1}, \ldots, \gamma_{k}\right) & =v\left(e_{1}^{*} X_{1} e_{1}, \ldots, e_{1}^{*} X_{k} e_{1}\right) \\
& \leqslant \sup \left\{v\left(x^{*} X_{1} x, \ldots, x^{*} X_{k} x\right): x \in \mathbb{C}^{n}, x^{*} x=1\right\} \\
& =r_{\nu}\left(X_{1}, \ldots, X_{k}\right) \\
& \leqslant v\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) \\
& =v\left(\left|\gamma_{1}\right|, \ldots,\left|\gamma_{k}\right|\right) .
\end{aligned}
$$

Therefore, the proof is complete.
In the final result, we state some inequalities about the joint numerical radius of the direct sum of matrices.

Theorem 2.18. Let $X_{1}, X_{2}, \ldots, X_{k} \in \mathbb{M}_{n}$ and $1 \leqslant p \leqslant \infty$. Then

$$
\begin{aligned}
r_{\ell_{\infty}}\left(X_{1}, \ldots, X_{k}\right) \leqslant \ell_{\infty}\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) & =r\left(X_{1} \oplus \cdots \oplus X_{k}\right) \\
& \leqslant r_{\ell_{p}}\left(X_{1}, \ldots, X_{k}\right) \\
& \leqslant \ell_{p}\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) .
\end{aligned}
$$

Moreover, if $X_{i} \neq 0$ for all $i=1, \ldots, k$, then

$$
r\left(X_{1} \oplus \cdots \oplus X_{k}\right)=\ell_{p}\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) \Longleftrightarrow k=1 .
$$

Proof. The first and last inequalities follow from Proposition 2.14. It is clear that there exist $j \in\{1,2, \ldots, k\}$ and a unit vector $x \in \mathbb{C}^{n}$ such that

$$
\begin{aligned}
\ell_{\infty}\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right) & =r\left(X_{1} \oplus \cdots \oplus X_{k}\right) \\
& =\max _{1 \leqslant i \leqslant k} r\left(X_{i}\right) \\
& =\left|x^{*} X_{j} x\right| \\
& \leqslant \ell_{p}\left(x^{*} X_{1} x, \ldots, x^{*} X_{k} x\right) \\
& \leqslant r_{\ell_{p}}\left(X_{1}, \ldots, X_{k}\right) .
\end{aligned}
$$

So, the proof of the first assertion is complete. Now, to prove the second assertion, we assume that $X_{i} \neq 0$ for all $i=1, \ldots, k$, and $p<\infty, r\left(X_{1} \oplus \cdots \oplus X_{k}\right)=\ell_{p}\left(r\left(X_{1}\right), \ldots, r\left(X_{k}\right)\right)$ and it is possible that $k \geqslant 2$. Let $j \in\{1, \ldots, k\}$ be such that

$$
\max _{1 \leqslant i \leqslant k} r\left(X_{i}\right)=r\left(X_{j}\right) .
$$

Therefore, we have

$$
r\left(X_{j}\right)=\left(\left(r\left(X_{j}\right)\right)^{p}+\sum_{i=1, i \neq j}^{k}\left(r\left(X_{i}\right)\right)^{p}\right)^{1 / p} .
$$

Hence, $X_{i}=0$ for all $i \neq j$, which is a contradiction. The converse of the second assertion, i.e., the result for the case $k=1$, is easy to investigate. Also, the result is trivial for the case $p=\infty$. So, the proof is complete.

## Acknowledgments

The authors wish to express their gratitude to anonymous referees for helpful comments and useful suggestions which greatly improved the presentation of the original manuscript.
